

Your Homepage **Practising HTML**

Your task is to create a new HTML page and name it Home.html. This page will be the landing/home page for a website about you! Include general information about you in the body of this page.

You will need to include different tags for formatting text, adding images, links (just to Google for now), changing colour, and other changes you feel would enhance your page. Refer back to the example done in class and/or use the [w3schools tutorials](#).

Remember to find copyright free pictures when creating your webpage and to save your images in the correct spot.

Items you need to ensure to include in your page:

- a comment stating your name and date
- head
- title
- body
- at least one list
- navigation/button link to Google (we will add more links as we create more pages)
- ensure all tags are closed

Challenge:

Research CSS to create rules for navigation/buttons, colour (font, background, etc), font type, and layout/boxes. You can use the [w3schools tutorials](#) or [EASY! Hand-code an HTML + CSS layout](#).
